4 GENERAL REQUIREMENTS

This document provides all registered data values to be used in products that conform to the RPF military standard (MIL-STD-2411). The data includes identification codes, attribute and parameter tables, and other tables required for RPF products. RPF includes several distinct file types (e.g., [table of contents file], [frame file]). Some of the registered data values found in this document are unique to particular file types, and others are found in several different file types.

The specific registered values are listed in section 5, Detailed Requirements. The format is such that new registered values can easily be added to specific subsections. Where applicable, unused identification codes have been marked as reserved for future use.

Note: Change 3 of MIL-STD-2411-1 resulted in the addition of 102 data series codes to the table in 5.1.4.

MIL-STD-2411-1  
w/CHANGE 3

## 5 DETAILED REQUIREMENTS

Section 5 is a listing of the registered data values that are used in RPF products.

Each of the subsections in section 5 will include a description of the registered data unique to that subsection, the code or ID corresponding to the data field, and, in some cases the size and data type of that code. The data types used are listed in TABLE I and defined in MIL-STD-2411. All registered data field types and sizes are defined in MIL-STD-2411.

TABLE I. Data types and their abbreviations

Data Type	Abbreviation
ASCII string	ascii
Bit string	bits
Byte string	byte
Boolean	bool
Integer (signed)	ints
Integer (unsigned)	uint
Real	real

Section 5.1 describes global data. Global data is defined here as data that can occur in more than one type of RPF file (i.e., <section/component id> values are necessary in all RPF files). Section 5.2 describes data that is used only in the [table of contents file]. Section 5.3 describes data that is used only in the [frame file].

MIL-STD-2411-1  
w/CHANGE 3

### 5.1 Global data.

Data in this section will pertain to information that may be used in more than one type of RPF file.

#### 5.1.1 Section/Component ID codes

<section/component id>	[section/component]
1-127	Reserved for future standardization
128	header component

150	frame file index section subheader
151	frame file index subsection
152	color table index section subheader
153	color table index record
154-65535	Reserved for future standardization

#### 5.1.2 Color/Grayscale section codes.

The following sections define the valid [color/grayscale section] codes currently defined for RPF products, which include <color/grayscale table id> codes and <color converter codes>.

The two types of table id's can be defined as traditional color/grayscale tables that contain values for the various color planes and/or bands within an image, and color converter tables,

MIL-STD-2411-1  
w/CHANGE 3

which define a mapping between two color/grayscale tables. Sections 5.1.2.1 and 5.1.2.2 describe the two [color/grayscale] section codes in more detail.

#### 5.1.2.1 Color table codes.

Each of the color/grayscale tables identified in the table below represents a particular organization of the color planes in the table. For example, a color table containing Red, Green and Blue (RGB) color planes would have an id of one indicating an RGB arrangement of the table. Examples of other arrangements of the color table that are currently registered in RPF include Red, Green, Blue, Monochromatic (RGBM), Monochromatic (M), and Cyan Magenta Yellow, Black (CMYK), which is often used in color printing.

<color/grayscale table id>	Description
1	RGB
2	RGBM
3	M
4	CMYK
5-65535	Reserved for future standardization

#### 5.1.2.2 Color conversion codes.

The color conversion table maps the colors from one color/grayscale table into another color/grayscale table. If a user is unable, or does not choose, to use the primary color/grayscale table in an RPF file, the color conversion table can be used to map the primary colors into the closest matching colors within the alternate table. These names used to describe the <color/grayscale table id>'s begin with the letters CCT/. The number immediately after the slash (/) is the <color/grayscale table id> of the primary color table, and the number after the arrow (->) is the alternate color table id. In cases where the primary and alternate color tables contain the same color planes, the numbers after the slashes will be the same. In these cases the color converter table is often used to map a larger number of colors in the primary color table to a smaller number of colors in the alternate color table.

a. As an example of the use of a color conversion table, assume that an RPF file has two <color/grayscale tables id>s and one <color converter table id>. The two [color/grayscale table] are RGBM (<color/grayscale table id> = 2) and therefore the appropriate [color converter table] would map the primary RGBM into the alternate RGBM, (<color converter table id> = 5). The color conversion table is a mapping of the colors from the

MIL-STD-2411-1  
w/CHANGE 3

primary RGBM color table to the alternate RGBM color table as shown in figure 1. A call to display a color X from the primary color table will be routed to the color conversion table, where the index of X will be mapped to the index of Y, a color in the alternate color table.

<color converter table id>	Description
1	CCT/1->1
2	CCT/1->2
3	CCT/1->3
4	CCT/1->4
5	CCT/2->2
6	CCT/2->3
7	CCT/2->4
8	CCT/3->3
10-65535	Reserved for future standardization

### 5.1.3 Zone codes

Zone codes are used in conjunction with the data series codes (5.1.4) to construct the <data series and zone> codes in 5.1.5. For products where zone code and/or data series is not applicable, the <data series and zone codes> shall consist of a

MIL-STD-2411-1

3-byte descriptor applicable to a particular product. No <data series and zone codes> are currently registered for such products.

Zone Number	Equatorward Latitude	Midpoint Latitude	Poleward Latitude

2,B	32°	41.12682127°	48°

8,H	76°	78.17283750°	80°
9,J	80°	—	90°

#### 5.1.3.1 Zone codes for DTED data

Zone codes are used in conjunction with the data series codes (5.1.4) to construct the <data series and zone> codes in 5.1.5. The zone codes for RPF data that is zoned similar to DTED data have the following zone codes.

Zone Number	Equatorward Latitude	Poleward Latitude
1,6	0°	50°
2,7	50°	70°
3,8	70°	75°
4,9	75°	80°
5,A	80°	90°

#### 5.1.4 Data series codes

The data series codes are used in conjunction with the zone codes (5.1.3) to construct the <data series and zone> codes in 5.1.5. The specific methodology for creating the data series and zone codes is described in MIL-STD-2411.

5.1.5 Data series and zone codes

The <data series and zone> codes are three digit alphanumeric codes derived from the two digit Data Series Code (see 5.1.4) and the one-digit Zone Code (see 5.1.3). The following are examples of valid codes currently defined for RPF data. Other valid <data series and zone> codes (for city graphics, etc.) can be created by combining data series codes with the ARC zonecodes in the same fashion.

### 5.3.3 Relationship code

The <relationship code> describes the relationship between two or more RPF [frame file]s. Valid codes are listed below.

Code	Description
1	Stereographic pairs
2	Legend Image
3-65535	Reserved for future standardization

### 5.4 NITF Registered Data Tags

The following codes are valid NITF registered data tags for use by RPF products which are written in an NITF message. The official register of tagged data extensions is located under the RPF group at [http://jitc.fhu.disa.mil/nitf/tag\\_reg/tag\\_reg.html](http://jitc.fhu.disa.mil/nitf/tag_reg/tag_reg.html). Changes to this group are managed through the same DoD and NGA processes as the codes listed in this document.

Tag	Description
RPFHDR	User Defined Header Section for RPF
RPFIMG	User Defined Image Section for RPF
RPFDES	Data Extension Segment for RPF

6 NOTES

This section contains information of a general or explanatory nature that may be helpful, but is not mandatory.

6.1 Intended use

This document is intended for use with MIL-STD-2411, Military Standard for Raster Product Format (RPF), and all specifications governed by that military standard. Identification codes and values tabulated in this document are the registered data values to be used in all products conforming to the RPF standard. The registered data values are included in this document, separate from MIL-STD-2411 so that new values can easily be added to the registered data set without modifying the governing standard.

6.2 Acquisition requirements

When this standard is used in acquisition, the applicable issue of DODISS must be cited in the solicitation (see 2.1.1 and 2.2).

6.3 International standardization agreements

This section is not applicable to this standard.

6.5 Changes from previous issue

See the summary of change 3 modifications on page iii. The margins of this standard are marked with vertical lines to indicate modifications generated by this change. This was done as a convenience only and the Government assumes no liability whatsoever for any inaccuracies in these notations. Bidders and contractors are cautioned to evaluate the requirements of this document based on the entire content irrespective of the marginal notations.
